

Living Well with Diabetes

Types of insulin and length of activity

There are several types of insulin available to help keep your blood sugar levels as close to normal as possible. Your need for insulin is different from other people with diabetes. The type of insulin you take and when you take it depends on your individual needs.

Your doctor will work with you to find the type of insulin, the dose, and the timing of your doses that are best for you.

Here are the types of insulin and how each works:

Fast-acting insulin

These types of insulin are designed to take care of the sugar a person eats. For most people, fast-acting insulins follow these ranges:

- Aspart Starts to act in 5 to 15 minutes, peaks in 90 minutes, lasts 3 to 4 hours
- Lispro Starts to act in 5 to 15 minutes, peaks in 90 minutes, lasts 3 to 4 hours
- Regular Starts to act in 30 to 60 minutes, peaks in 2 hours, lasts 4 to 6 hours

Intermediate and long-acting insulin

These types of insulin, also called basal or background insulin, work continuously, similar to the way a normal pancreas produces insulin. They are absorbed slowly and last from 10 to 24 hours, depending on which kind of insulin you use. For most people basal insulin types follow these ranges:

- NPH Starts to act about 2 hours after taking, peaks at 6 to 8 hours, lasts 10 to 16 hours
- Glargine Starts to act about 2 hours after taking, and can last 20 to 24 hours
- Detemir Starts to act about 2 hours after taking, and lasts between 14 and 24 hours

Combination insulin

Combination insulin mixtures deliver fixed doses of insulin and have a later action with an earlier and stronger peak. Combination insulin includes human and analog mixtures:

Human mixtures combine NPH and regular insulin.

• 70/30 = 70 % NPH insulin and 30 % regular insulin

Analog mixtures combine fast-acting analog insulin with protamine for extended action.

- 70/30 = 70 % aspart protamine and 30 % aspart
- 75/25 = 75 % lispro protamine and 20 % lispro

The types of insulin are listed below. The first word is the generic name and the second word is a brand name of the insulin.

Action in hours	0	2	4	6	8	10	12	14	16	18	20	22	24
Fast-acting Insulin: Aspart (Novolog) Lispro (Humalog)													
Regular (Novolin R)													
Intermediate-acting Insulin: NPH (Novolin N, Humulin N)													
Long-acting Insulin: Glargine (Lantus) Detemir (Levemir)													
Human Mixtures: Includes 70/30 mixtures of Regular and NPH insulin. These start later and peak earlier and higher than long-acting insulin.													
Analog Mixtures: Includes 75/25 and 70/30 mixtures of fast- acting analog insulin with protamine. They also start later and peak earlier and higher than long-acting insulin.
