

NEUROSURGERY

Our team consists of the highest quality surgeons from some of the country's best medical training grounds. We have all had additional specialized fellowship training to further expand our skills. We also actively improve our knowledge through continuing education to ensure that we have the most current skills and techniques available to treat these medical conditions. Our commitment is to provide expert care to everyone.

Our neurosurgery team includes experts in brain and spine tumors, movement disorders and functional neurosurgery as well as masters of minimally invasive spine surgery and complex spinal conditions. We operate on patients from all over the region at our partner hospital, Swedish Cherry Hill hospital as well as at our Seattle Capitol Hill Kaiser campus.

Our surgical physician assistants help us assess and treat our patients and provide excellent care. All of our surgical PAs have been selected by our surgical team for their achievements and expertise. Our PAs may meet with patients at pre- and postoperative visits and treat patients if they don't require immediate surgical care. Their knowledge and ability to help with caseloads and patient care is a tremendous asset to us and a big advantage to the patient.

Our experienced team treats a number of complex situations

- Primary and metastatic brain tumors
- Pituitary tumors
- Peripheral nerve tumors
- Spinal cord tumors and tumors of the bony spine
- Spinal degenerative conditions, including herniated disc and spinal stenosis
- Chiari malformation
- Trigeminal neuralgia and other pain disorders
- Brain hemorrhage (bleeding)
- CSF leak (cerebrospinal fluid)
- Epilepsy
- Hydrocephalus
- Movement disorders (e.g., Parkinson's disease, essential tremor)
- Spinal deformity, including scoliosis
- Spinal cord injury

Elite training means superior care

“

In the hardest time, you don't know what's happening. And throughout everything, Dr. Lee really restored hope to my heart that everything was going to be okay—and that he was there to make it okay.

—Michelle Small, patient
